

# TOPICS IN JOIN

- WHAT IS JOIN?
- USE OF JOIN
- JOIN TYPES
- WHICH JOIN TO USE
- JOIN SYNTAX
- EXAMPLES IN SQL

# SQL JOIN

- **JOIN** means to combine something.
- A **JOIN** clause is used to combine data from two or more tables, based on a related column between them
- Let's understand the joins through an example:

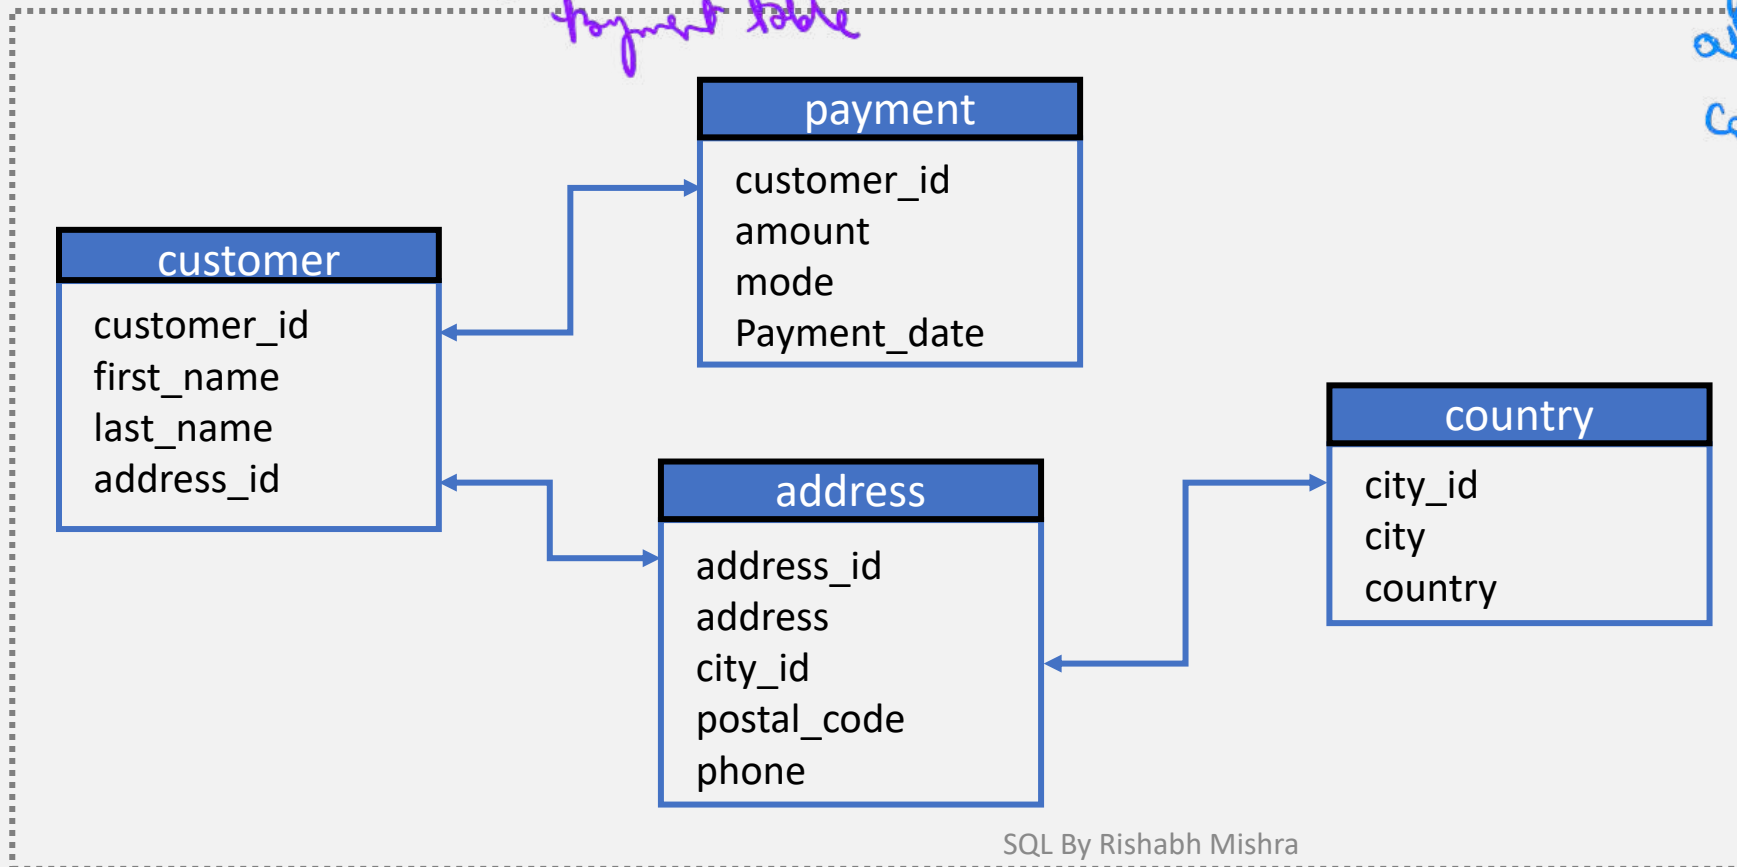

# JOIN Example

Question: How much amount was paid by customer 'Madan', what was mode and payment date?

Here there are 4 tables +

customer table,  
Payment,  
address  
country

connected  
to each  
other  
through  
common  
columns

# JOIN Example

Customer Table

<u>customer_id</u> [PK] bigint	<u>first_name</u> character varying (50)	<u>last_name</u> character varying (50)	<u>address_id</u> bigint
1	Mary	Smith	5
2	Madan	Mohan	6
3	Linda	Williams	7
4	Barbara	Jones	8
5	Elizabeth	Brown	9

Question: How much amount was paid by customer 'Madan', what was mode and payment date?

So, from first table, from name 'Madan' we get the ID, then second table, from id, we get amount, mode, date.

Payment Table

<u>customer_id</u> [PK] bigint	<u>amount</u> bigint	<u>mode</u> character varying (50)	<u>payment_date</u> date
1	60	Cash	2020-09-24
2	30	Credit Card	2020-04-27
3	90	Credit Card	2020-07-07
4	50	Debit Card	2020-02-12
5	40	Mobile Payment	2020-11-20

Answer: Amount = 30,  
Mode = Credit Card,  
Date = 2020-04-27

! Here to join, both the table, we can do it through customer\_id

# TYPES OF JOINS

- INNER JOIN
- LEFT JOIN
- RIGHT JOIN
- FULL JOIN

*or left outer Join  
or Right outer Join  
or Full outer join*

# INNER JOIN

→ helps us to give common values in both the tables

- Returns records that have matching values in both tables

inner\_join(x, y)

1	x1	1	y1
2	x2	2	y2
3	x3	4	y4

∴ So, output, will be 1, 2

(since, it is there in both the table)

# LEFT JOIN

- Returns all records from the left table, and the matched records from the right table

# RIGHT JOIN

- Returns all records from the right table, and the matched records from the left table

# FULL JOIN

- Returns all records when there is a match in either left or right table

# Which JOIN To Use

- **INNER JOIN:** Returns records that have matching values in both tables
- **LEFT JOIN:** Returns all records from the left table, and the matched records from the right table
- **RIGHT JOIN:** Returns all records from the right table, and the matched records from the left table
- **FULL JOIN:** Returns all records when there is a match in either left or right table

# JOIN CHEAT SHEET

## SQL JOINS

```
SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
LEFT JOIN TableB B
ON A.Key = B.Key
WHERE B.Key IS NULL
```

```
SELECT <select_list>
FROM TableA A
INNER JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
RIGHT JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
RIGHT JOIN TableB B
ON A.Key = B.Key
WHERE A.Key IS NULL
```

```
SELECT <select_list>
FROM TableA A
FULL OUTER JOIN TableB B
ON A.Key = B.Key
```

```
SELECT <select_list>
FROM TableA A
FULL OUTER JOIN TableB B
ON A.Key = B.Key
WHERE A.Key IS NULL
OR B.Key IS NULL
```
